<b>Office Action Summary</b>	<b>Application No.</b>	<b>Applicant(s)</b>	
	10/788,515	BIRD ET AL.	
	<b>Examiner</b>	<b>Art Unit</b>	
	Angela M. Lie	2163	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) ☒ Responsive to communication(s) filed on 20 June 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) ☒ Claim(s) 1-24 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-24 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 27 February 2004 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
 Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
 Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.

## DETAILED ACTION

### ***Claim Rejections - 35 USC § 103***

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. **Claim 1-4, 7, 9-12, 15, 17-20 and 23 are rejected under 35 U.S.C. 103(a) as being unpatentable over McNabb et al (US Patent No. 6289462) in view of Hue et al (US Publication No. 2002/0126845).**

**As to claims 1, 9 and 17,** McNabb discloses a data processing system comprising a database (Figure 9, element 510), the database comprising classified table elements (column 18, lines 56-58), the data processing system coupled to a classification engine (Figure 9, element 504) adapted to provide indicators of approval or non approval to permit (column 14, lines 19-26), for a request associated with a requestor (column 14, lines 19-26), access to contents of the classified table elements (column 8, lines 41-45), a method for retrieving data from the classified table elements (column 18, lines 52-58), the method comprising the steps of: receiving the request (Figure 9, element 502) at the database (Figure 9, element 510, wherein granted requests will be forwarded to the database so that the desired data can be uploaded by the requesting party), from the requestor (Figure 9, element 500), to access the contents of the classified table elements (column 8, lines 11-15); for each classified

Art Unit: 2163

table element, the database (510) asking the classification engine (504) to provide an indication of whether the requestor associated with the request is to be permitted access to the contents of the respective classified table element (if request is forwarded to the database, it means that the access was granted, the database requires confirmed request in order to provide the access to the data, i.e. the database is asking for the identification information); and accessing the contents of each classified engine, the approval indicators indicating that the requestor is permitted to access the contents of the respective classified table element (column 14, lines 56-67, and column 15, lines 1-28); wherein the asking step comprises sending the request (Figure 9, element 502) to the classification engine (Figure 9, element 504) coupled to the data processing system (Figure 9, element 510). McNabb does not explicitly teach the data processing system being external to a classification engine, however Hue teaches a system performing wireless transaction wherein the authentication module (security gate) is external to a database (paragraph 57). It would have been obvious to one of the ordinary skill in the art during the time the invention was made to have external authentication unit, as taught by Hue, in McNabb's information system, because it is a matter of a design choice if a database and authentication software reside on a single server or plural servers. The design is usually determined by the available hardware (cost) and the amount of the databases holding classified data (i.e. if there are plural databases it might be more beneficial to share one classification unit, so in this case it should be a separate device).

**As to claims 2, 10 and 18**, McNabb discloses the method comprising the steps of: providing to the requestor, access to the contents of each classified table element for which an approval indicator is received; and, denying, to the requestor, access to the contents of each classified table element for which a non-approval indicator is received from the classification engine, the non-approval indicator indicating that the requestor is not permitted to access the contents of the respective classified table element (column 14, lines 49-67, and column 15, lines 1-28).

**As to claims 3, 11 and 19**, McNabb discloses the method wherein: the classified table elements are included in a classified table contained in the database (column 18, lines 52-58); each classified table element is associated with a respective classification label (column 14, lines 49-54); and the classification engine (Figure 9, element 504) uses the classification label for each classified table element and a classification associated with the requestor in determining whether to provide the approval indicator and whether to provide the non-approval indicator for the respective classified table element (column 14, lines 19-26).

**As to claims 4, 12 and 20**, McNabb discloses the method wherein the classified table element is a classified table row (column 18, lines 55-58).

**As to claims 7, 15 and 23**, McNabb discloses the method wherein in the asking step, the classification engine (Figure 9, element 504) is invoked through at least one processing exit (Figure 9, element 502) in the data processing system (Figure 9, element 500).

3. Claims 5, 6, 13, 14, 21 and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over McNabb et al (US Patent 6289462) in the view of Hue et al (US Publication No. 2002/0126845) and further in view of Tashenberg (US Publication 2001/0034711).

As to claims 5, 13 and 21, McNabb teaches the method further comprising the executable instructions comprising added instructions for invoking the classification engine such that for each row of the classified table (column 18, lines 56-58), arguments for at least one classification parameter are passed to the classification engine (Figure 9, element 504) for use in generating one of the approval indicator and non-approval indicator for the respective row (column 14, lines 19-26 and lines 49-54), where the arguments comprise both data stored in one or more classification columns of the table (i.e. data that is about to be accessed) and data used to determine the classification associated with the requestor (column 14, lines 19-26, i.e. SL (sensitivity label)). Neither McNabb nor Hue explicitly teaches that the original request is compiled into executable instructions. Tashenberg teaches a network system wherein request is converted into machine executable instructions (paragraph 92). It would have been obvious to one of the ordinary skill in the art during the time the invention was made to compile the request into machine executable instruction as taught by Tashenberg, and use this in McNabb's secure computer operating system, because compiling the messages or requests into computer readable instruction is commonly known and used. Furthermore compiling step is essential in the system operation because the interface that allows the user to request access to certain data is in a human friendly readable

form, not in a computer language (binary code), and therefore it needs to be converted to allow computer to process the instructions.

**As to claims 6, 14 and 22,** McNabb discloses the method wherein the classification engine (Figure 9, element 504) is adapted to generate the indicators (column 14, lines 19-26, i.e. SL) using a classification level derived from data stored in the at least one classification column of each respective row (column 18, lines 52-58) in accordance with a column mapping schema (i.e. the information about the access are derived from the ID and many other criteria, Figure 10).

4. **Claims 8, 16 and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over McNabb et al (US Patent 6289462) in the view of Hue et al (US Publication No. 2002/0126845) and further in view of Hepworth et al (US Publication 2006/0032920).** McNabb teaches all the limitations disclosed in claims 1,9 and 17 respectively, further he also teaches checking for each classified table element, whether decision contains one of an approval indicator and non-approval indicator associated therewith, and wherein the asking step is performed only when neither indicator is contained in the decision unit (Figure 9, element 504; since McNabb does not teach processing multiple requests from the same user at one point of time, it also indicates that when one request is processed, the asking step is held). McNabb does not teach explicitly that the decision about access approval is contained in cache. Hepworth teaches the system wherein authorization information is stored in a local cache. It would have been obvious to one of the ordinary skill in the art during the time the invention was made to store the approval status temporarily in cache memory as

taught by Hepworth, in McNabb's access security system, because it is well known in the art, that temporary information such as approval are stored for short period of time in cache or RAM because usually there is no need to store the authentication data on the hard disk. Furthermore in order to complete the transaction the response has to be placed in the memory that allows fast process between the requesting and processing units.

### ***Response to Arguments***

5. Applicant's arguments filed June 20, 2007 have been fully considered but they are not persuasive.

6. With respect to the applicant's assertion on page 12, second paragraph, stating that McNabb does not teach the request being sent to the database, the examiner disagrees. As clearly indicated in Figure 9 in the prior art, the request is eventually directed to the database. In order to process desired information, the approved requests have to be forwarded to the database so that the content of interest in the database is accessed.

### ***The Prior Art***

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Art Unit: 2163

- Zotto et al (US Publication 2004/0009815) disclose a managing access to content wherein the access to individual pieces of information is controlled.
- Larsen (US Publication 2005/0055581) discloses a process-based security comprising access rights look-up table.

***Inquiry***

8. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Angela M. Lie whose telephone number is 571-272-8445. The examiner can normally be reached on M-F.

9. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Don Wong can be reached on 571-272-1834. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

10. Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
